Towards the Analysis of Human Movement with **Humanoid Robots**

Miguel P. Xochicale, Chris Baber and Mourad Oussalah

Deadline: 28th of April 2017 April 10, 2017

Summary of research [1500 words]

The World Health Organization (WHO) pointed out that people worldwide are living longer. In 2015, 125 million people worldwide were aged 80 years or older and by 2050 there will be almost 434 million people in this age group worldwide, of which 80 % will live in low- and middle-income countries. Similarly, WHO highlighted that the improvement of methodologies for measurement, monitoring and understanding the elderly are a priority area of action. With this in mind, we 11 believe that we can address those areas of opportunity where humanoids robots can be used for 12 elderly care. For instance, (a) RI-MAN humanoid robot has facial recognition and a scent discerner 13 with the ability to carry patients to different sorrounding locations; (b) RIBA-II humanoid robot can carry people up to 80 kg; (c) Paro bot helps people with dementia to decrease stress or feelings 15 of loneliness; and (d) Palro humanoid robot can be used in entertainment activities such as dancing 16 or gaming. Recently, humanoid robots like Pepper and NAO have been used to understand human 17 emotions, or to perform therapies for rehabilitation with children or elderly people. In this talk, I will therefore present the methodologies for measurement, monitoring and understanding the 19 Human-Robot Interaction with the use of wearable inertial sensors. I will also present some results 20 of a group of persons interacting with NAO to show the remarkable capabilities of measuring 21 peer-to-peer influence when receiving instructions from the NAO. 23
